INTRODUCTION

This report summarizes the results for total coliform analyses of municipal raw water for 1990 and 1991. All samples were submitted to the Kingston MOE Regional Laboratory for analysis. A list describing the source(s) of the municipal raw water samples is included in this report.

The analysis of municipal raw water supplies is an important and integral component of a water quality monitoring program. The treatment of raw water supplies must be adequate to remove total coliform bacteria. These bacteria are indicators of the safety and the sanitary quality of potable water. Total coliforms are natural inhabitants of feces, sewage, soil and sediments.

Guidelines for the treatability limits for total coliforms in raw water sources have not been specified by the Ministry of the Environment. The limits for the numbers of total coliforms in treated water supplies are outlined in the companion report, BACTERIOLOGICAL RESULTS FOR MUNICIPAL TREATED WATER FOR 1991.
